

Assignment

Module 1.2 Motherboard and CPU

1. Draw a labeled diagram of an ATX motherboard and mark at least 8 different slots and ports (such as RAM slots, PCIe slots, SATA ports, USB headers, CPU socket, power connector, etc.).

2. Research and list 3 popular CPU socket types (for example: LGA1151, AM4, LGA1200) and name one compatible CPU model for each.

CPU Socket	Compatible CPU Example	Manufacturer
LGA1851	Intel Core Ultra 7 265K	Intel
AM5	AMD Ryzen 7 9800X3D	AMD
LGA1700	Intel Core i7-14700K	Intel

3. Explain in your own words the primary functions of the CPU and the chipset on a motherboard and describe how they work together when you open a music app like Spotify.

CPU (Central Processing Unit): The CPU is your computer's main processor. It does math, follows instructions, and runs all your programs. When you open Spotify, the CPU handles all the steps needed to start the app and play your music.

Chipset: The chipset is like a manager that helps the CPU talk to other parts of your computer, like USB devices, storage, and other hardware. It makes sure data moves smoothly between all these parts.

How they work together with Spotify: When you open Spotify, the CPU runs the app and processes what it needs to do. The chipset connects the CPU to your storage and other hardware, so Spotify can find its files and work with devices like speakers or headphones. Working as a team, they let Spotify load, stream, and play your music without problems.

4. Find a clear photo of a real motherboard (from the internet or your own device) and identify at least 5 different ports or slots by circling them and labeling each one.
